Solving things with bisection

Mathematical analysis

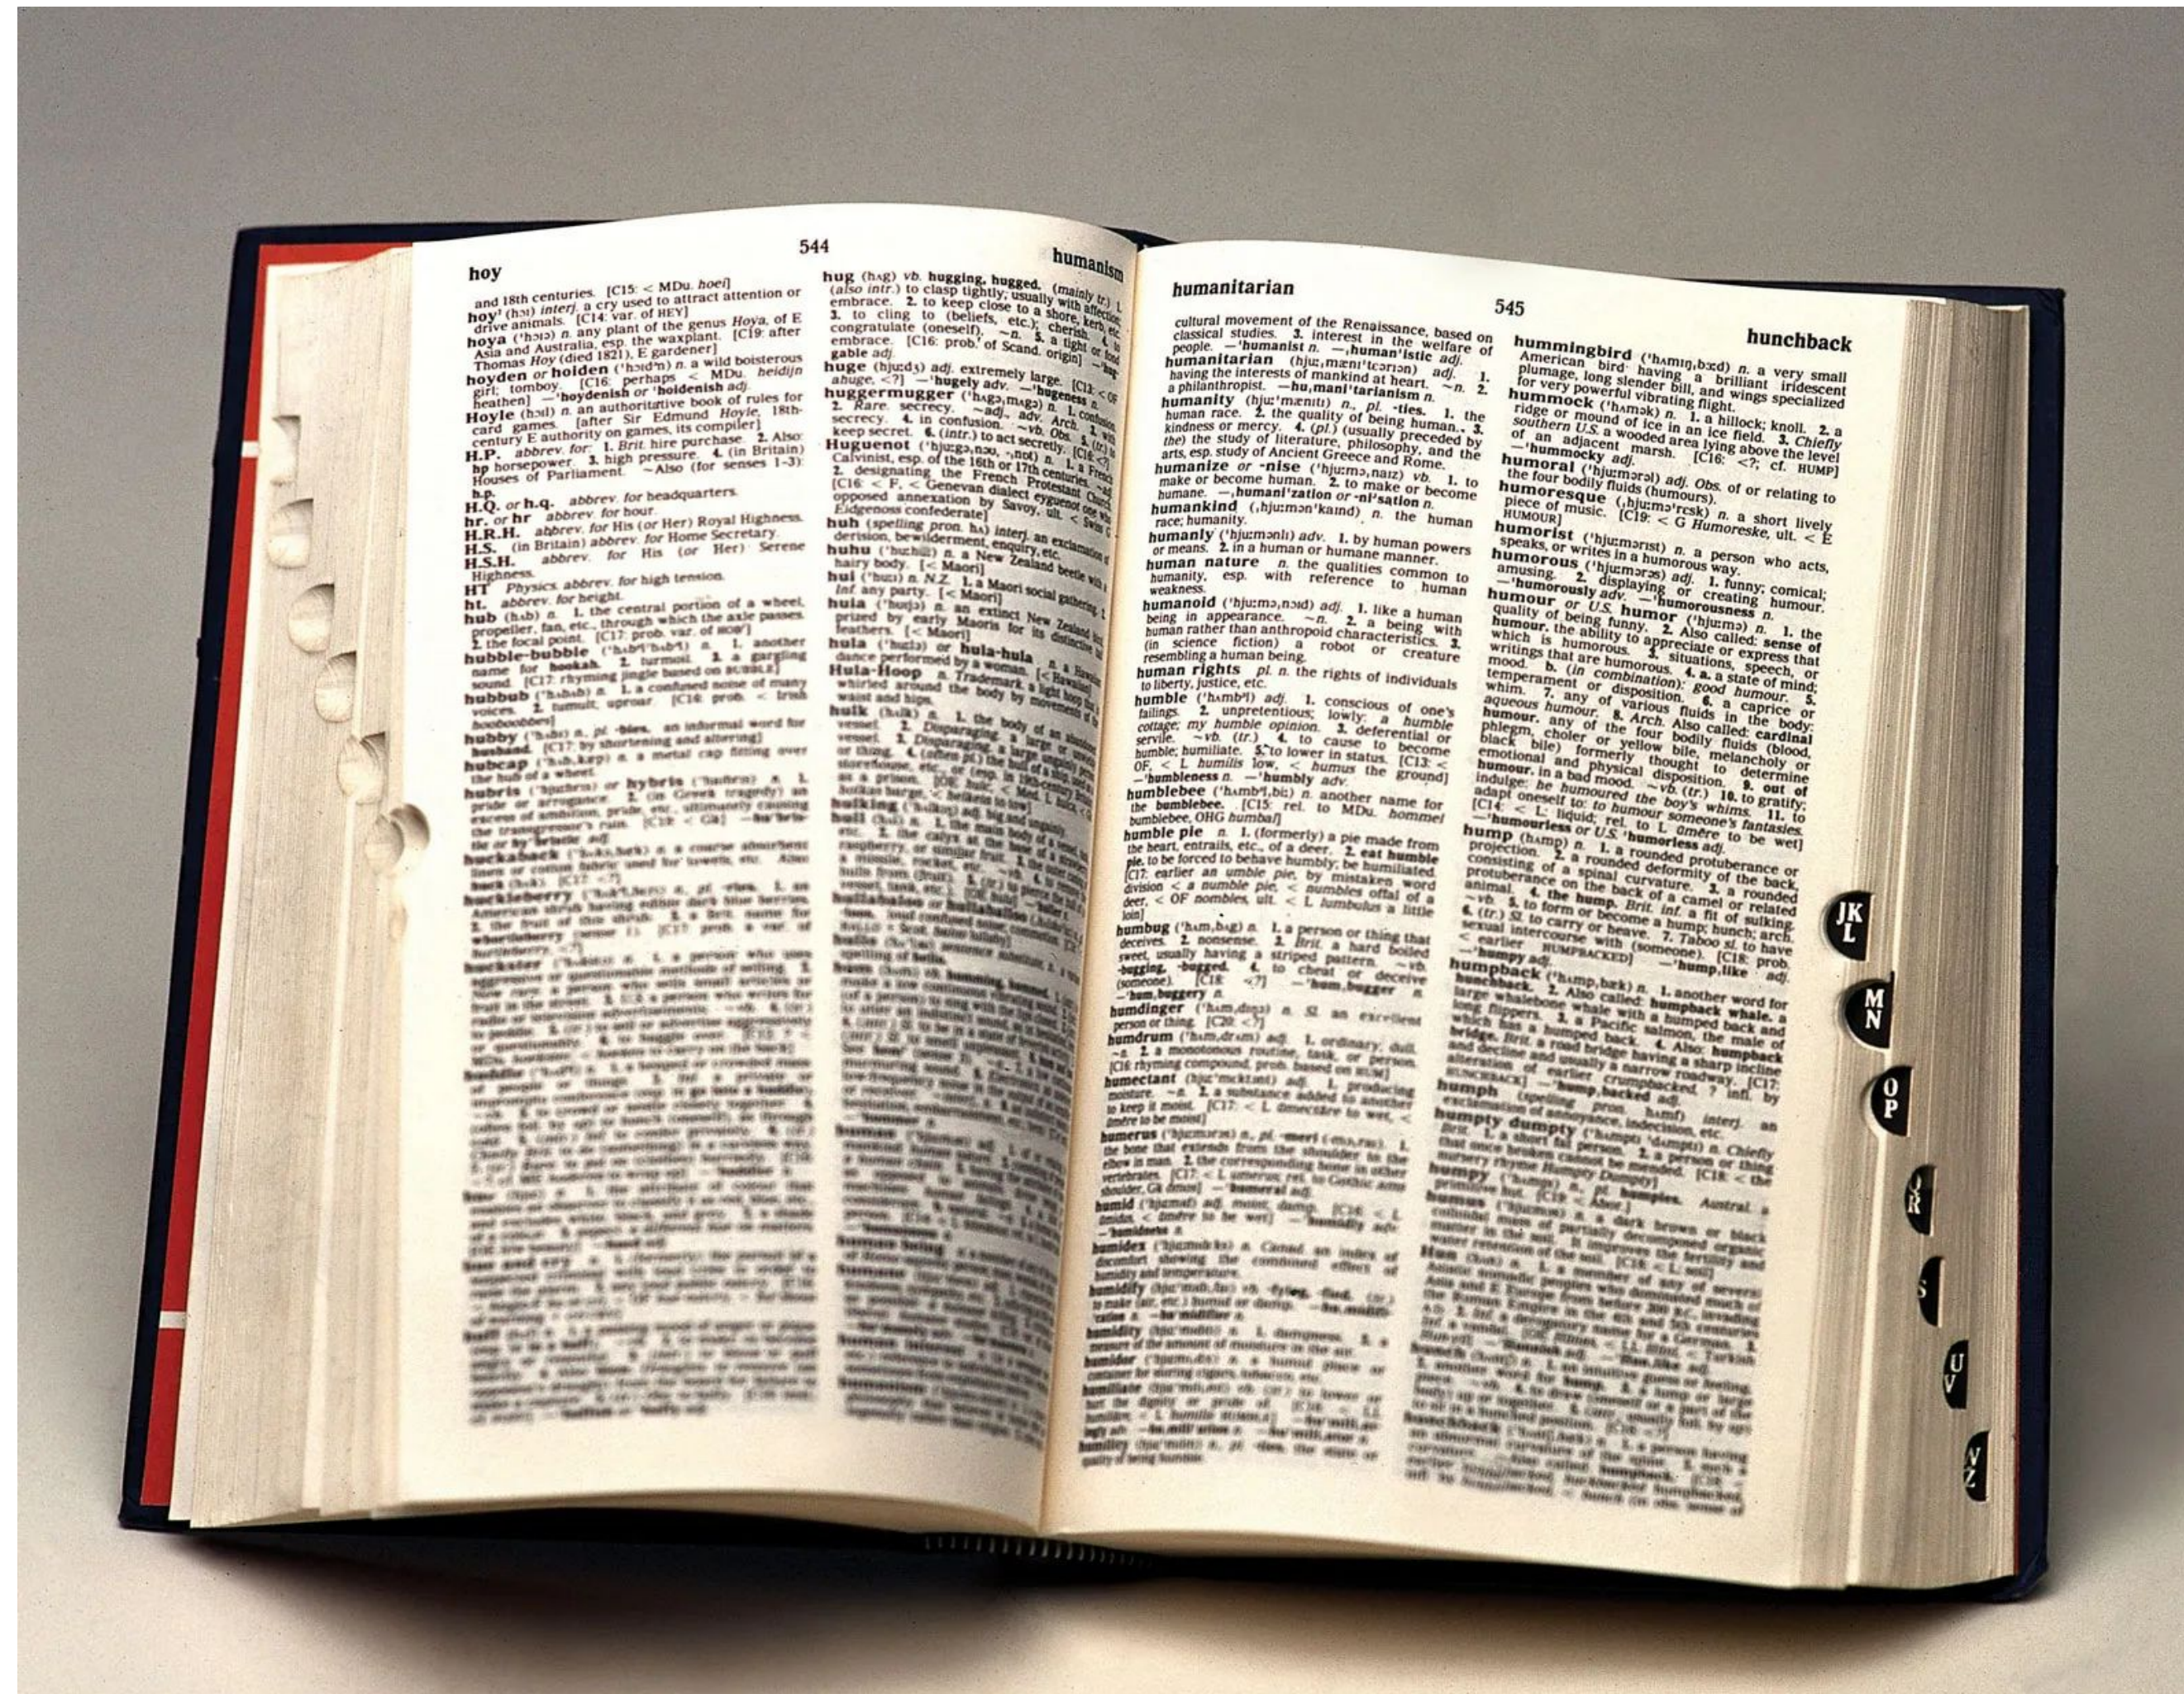

Bisection method

- Root-finding method $f(x) = 0$ for real numbers x
- Applies to continuous function defined on interval $I = [a, b]$
- Bolzano's theorem
 - Two values $f(a)$ and $f(b)$ with opposite signs has a root
- Repeatedly bisecting the defined interval
- And selecting of subinterval in which function changes sign
- Gives us a rough approximation of the root
- Solving equations in the real numbers

Guess the number between 0 and 100

Computer Science

Bisection by hand

	0	1	2	3	4	5	6
Search 50	11	17	18	45	50	71	95
	L=0	1	2	M=3	4	5	H=6
50 > 45 Take 2 nd half	11	17	18	45	50	71	95
	0	1	2	3	L=4	M=5	M=6
50 < 71 Take 1 st half	11	17	18	45	50	71	95
	0	1	2	3	L=4		
50 found at position 4	11	17	18	45	50	71	95
					M=4

Computer Science

Binary search

- Bisection search / binary search / logarithmic search
- Find the position within a **sorted** array

Performance:

- Worst-case: $O(\log n)$
- Best-case: $O(1)$
- Average: $O(\log n)$
- Worst-case space complexity: $O(1)$

"Binary Search" Algorithm
before interview.**

**Although the basic idea of binary search is comparatively straightforward,
the details can be surprisingly tricky**

Git bisect command

NAME

git-bisect - Use binary search to find the commit that introduced a bug

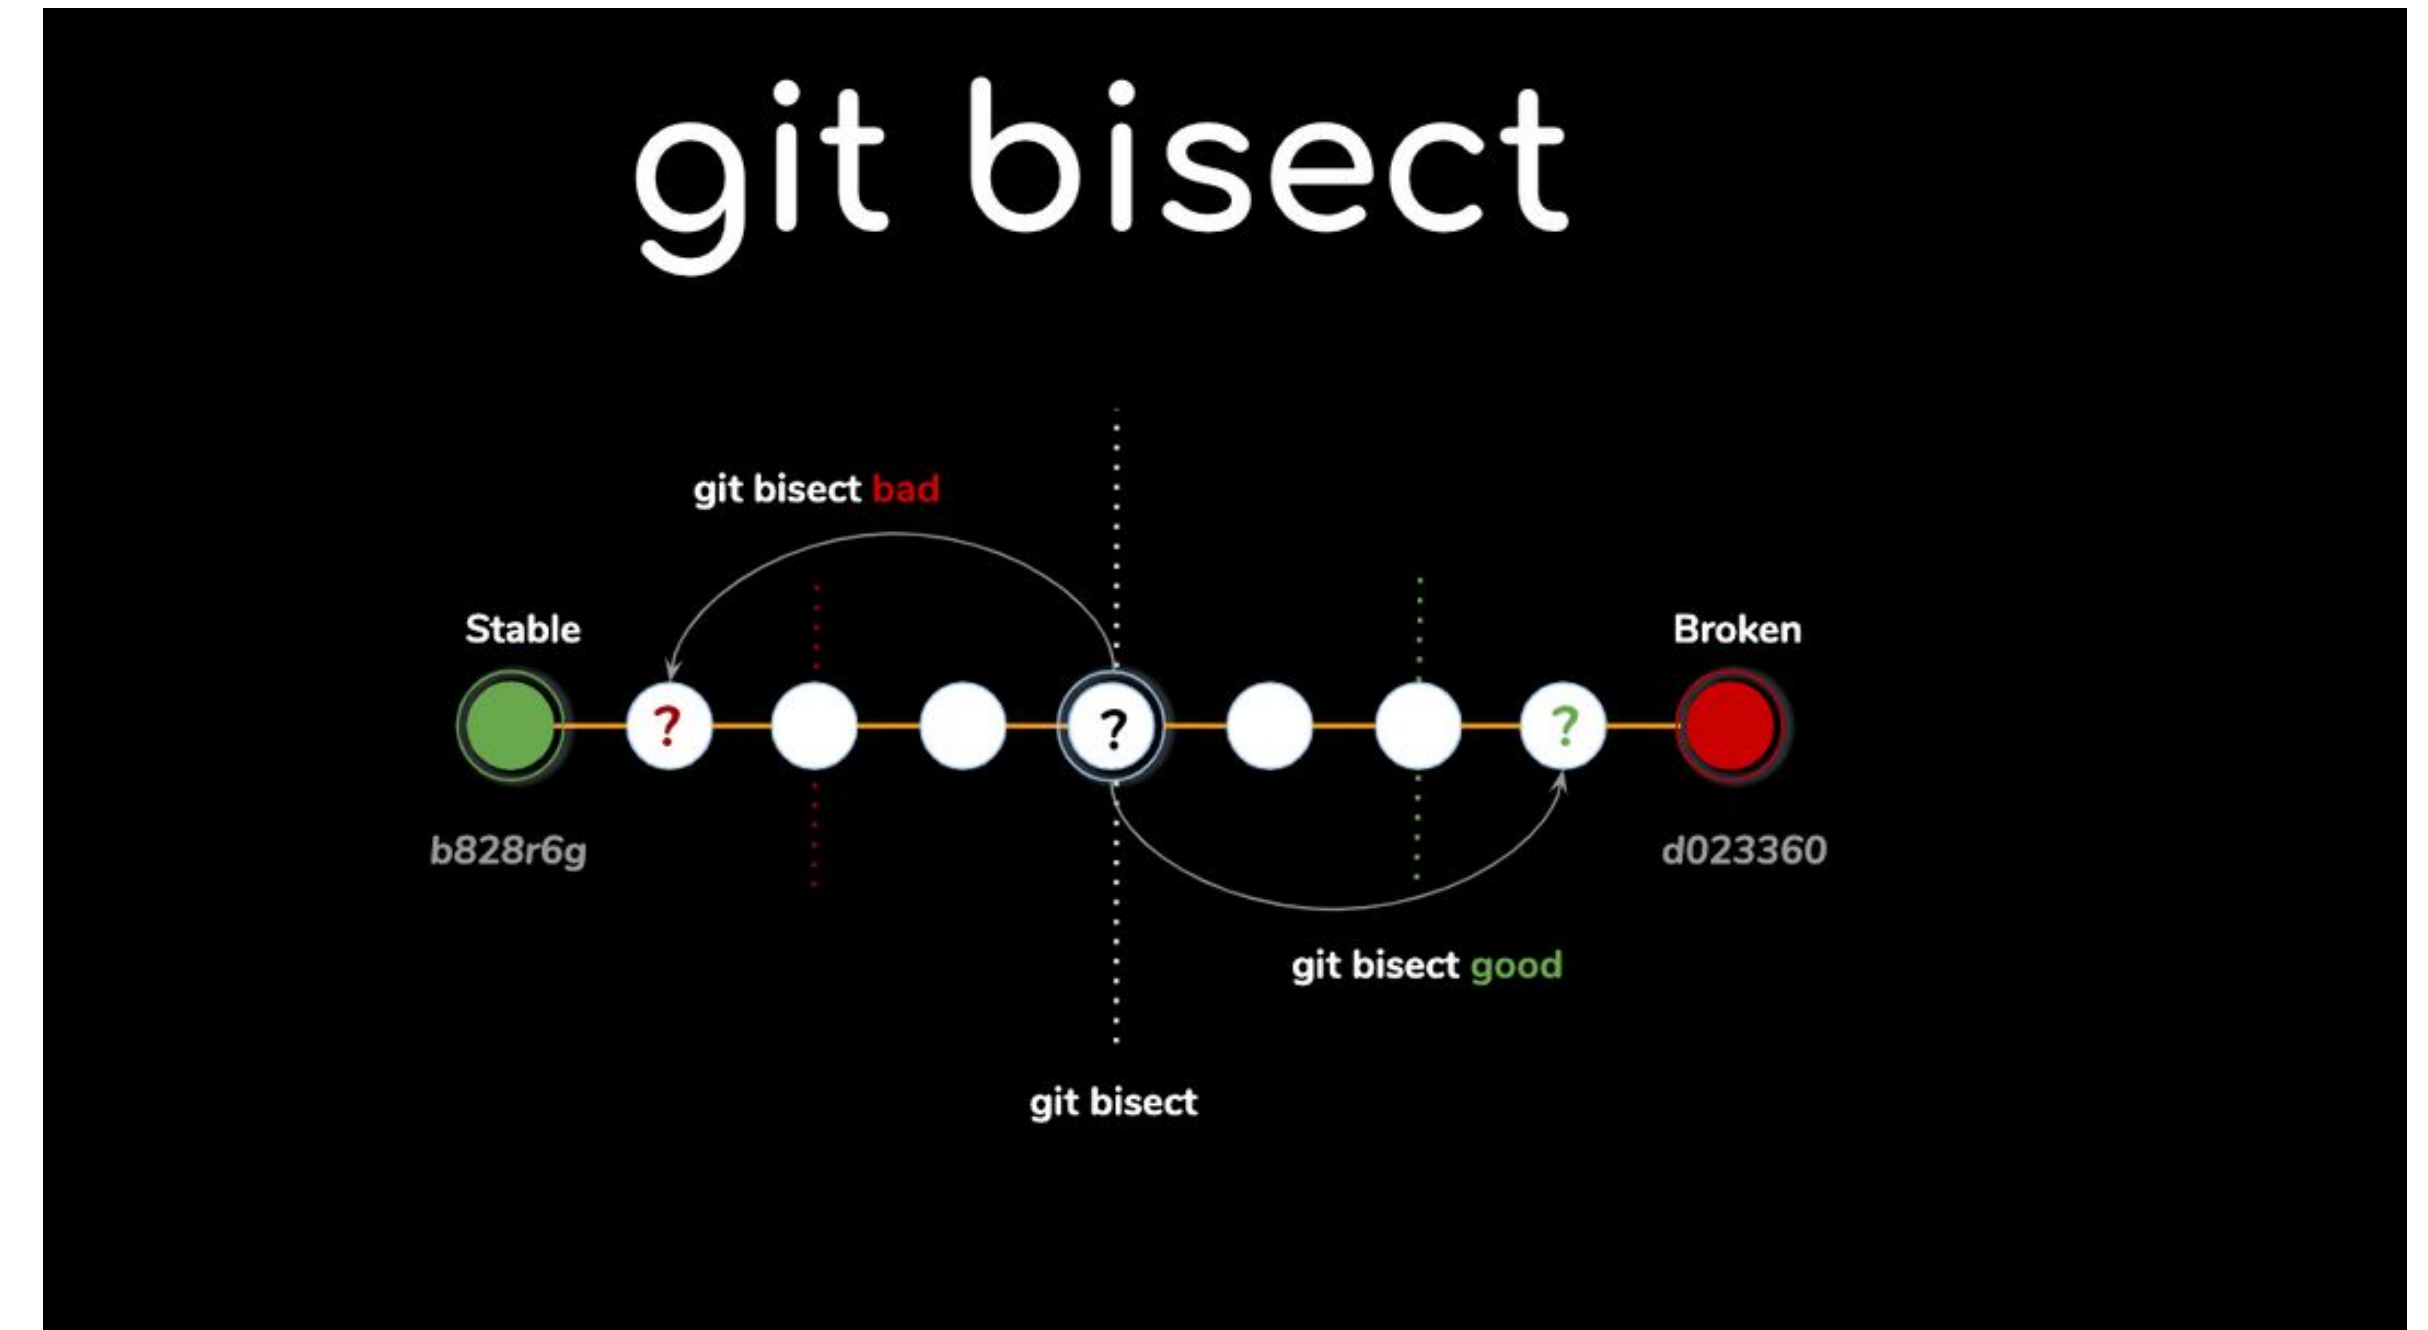

SYNOPSIS

```
git bisect <subcommand> <options>
```

DESCRIPTION

The command takes various subcommands, and different options depending on the subcommand:

```
git bisect start [--term-{new,bad}=<term> --term-{old,good}=<term>]
                [--no-checkout] [--first-parent] [<bad> [<good>...]] [--] [<paths>]
git bisect (bad|new|<term-new>) [<rev>]
git bisect (good|old|<term-old>) [<rev>...]
git bisect terms [--term-good | --term-bad]
git bisect skip [(<rev>|<range>)...]
git bisect reset [<commit>]
git bisect (visualize|view)
git bisect replay <logfile>
git bisect log
git bisect run <cmd>...
git bisect help
```

Why bother?

Number of commits	Steps to check
10	$\log_2(10) \sim 4$
100	~ 7
1k	~ 10
10k	~ 14
100k	~ 17
1M	~ 20
